Received 12 May 2014; accepted 23 June 2014

Key indicators: single-crystal X-ray study;  $T = 293$  K; mean  $\sigma(\text{C}-\text{C}) = 0.004$  Å; H-atom completeness 77%;  $R$  factor = 0.049;  $wR$  factor = 0.144; data-to-parameter ratio = 22.6.

In the title compound,  $[\{\text{Cu}_2\text{Na}_2(\text{C}_{10}\text{H}_2\text{O}_8)_{1.5}(\text{H}_2\text{O})_6\} \cdot \text{H}_2\text{O}]_n$ , the  $\text{Cu}^{2+}$  ion is hexacoordinated by five O atoms from benzene-1,2,4,5-tetracarboxylate ( $\text{btec}^{4-}$ ) ligands and one water molecule. The  $\text{Na}^+$  ion is also hexacoordinated, by four O atoms from  $\text{btec}^{4-}$  ligands and two water molecules. One of the two  $\text{btec}^{4-}$  molecules sits on a crystallographic inversion centre.  $\text{CuO}_6$  and  $\text{NaO}_6$  octahedra are connected, forming bi-dimensional layers. These layers, which extend parallel to the  $ac$  plane, are further interconnected by  $\mu_{10}$ - or  $\mu_{11}$ -bridging  $\text{btec}^{4-}$  ligands and by  $\text{O}-\text{H} \cdots \text{O}$  hydrogen bonds, involving both  $\text{btec}^{4-}$  ligands and water molecules, forming a three-dimensional network.

### 1. Comment

In recent years, much attention has been paid to coordination polymers that involve covalent bonds or supramolecular contacts. A huge number of novel compounds with interesting crystal structures and topologies have been reported. As part of this research, benzene-1,2,4,5-tetracarboxylate ( $\text{btec}^{4-}$ ) can be used as a ligand to form various supramolecular architectures through its four rigid carboxyl groups [see Camara *et al.* (2013), Luo *et al.* (2013), Gong & Zhang (2011), Liu *et al.* (2010), Zhang *et al.* (2007)]. In order to enrich this family of compounds, we recently undertook a study devoted to reactions of  $\text{H}_4\text{btec}$  with metal ions in gel media. In particular, we were interested in such reactions with agar-agar gel bridges in U-shaped tubes, and we have successfully synthesized a novel polymeric complex from  $\text{H}_4\text{btec}$  and copper (II) chloride. We report here the synthesis and the crystal structure of the title coordination polymer. As shown in Fig. 1, the asymmetric unit of the title compound contains two Cu(II) ions, two Na(I) ions, coordinated water molecules and three  $\text{btec}^{4-}$  ligands. One of the two crystallographically distinct  $\text{btec}^{4-}$  ligands is located on an inversion centre. One  $\text{btec}^{4-}$  ligand acts as a  $m_{10}$ -bridge that links six Cu(II) ions and four Na(I) ions, while the other acts as a  $m_{11}$ -bridge that links five Cu(II) ions and six Na(I) ions. Cu(II) ions are hexa-coordinated by five O atoms from four  $\text{btec}^{4-}$  ligands and one O atom from a water molecule, while Na(I) ions are hexa-coordinated by four O atoms from four  $\text{btec}^{4-}$  ligands and two O atoms from two water molecules. As shown in Fig. 2, two-dimensional Cu–O–Na layers extend parallel to the ac plane. Furthermore, these two-dimensional layers are interconnected by  $m_{10}$ - or  $m_{11}$ -bridging  $\text{btec}^{4-}$  ligands and by O—H $\cdots$ O hydrogen bonds, forming a three-dimensional framework.

### 2. Experimental

All reagents were used as obtained without further purification. Copper (II) chloride was purchased from STREM Chemicals. 1,2,4,5-benzenetetracarboxylic acid was purchased from Acros Organics. Its sodium salt was prepared by addition of four equivalents of sodium hydroxide to a suspension of 1,2,4,5-benzenetetracarboxylic acid in de-ionized water until complete dissolution. Then, the solution was evaporated to dryness. The solid phase was then put in suspension in ethanol, stirred and refluxed for 1 h. After filtration and drying in a desiccator, a white powder of tetrasodium 1,2,4,5-benzene-tetra-carboxylate was obtained (yield = 90%). Single crystals of the coordination polymer were obtained by slow diffusion of dilute aqueous solutions of Cu(II) chloride (0.25 mmol in 20mL) and of the sodium salt of 1,2,4,5-benzenetetra-carboxylic acid (0.25 mmol in 20mL) through agar-agar gel bridges in U-shaped tubes. The gel was purchased from Acros Organics and gelled according to established procedure [see for example, Henisch *et al.* (1988), Henisch *et al.* (1970), Daiguebonne *et al.* (2003)]. After several weeks, colorless single crystals were obtained.

### 3. Refinement

The H-atoms from water molecules that could be found in difference maps were included with constrained coordinates. Some hydrogen atoms could not be reliably located, so these have only been taken into account in the formula (*i.e.* not in the model).

**Figure 1**

Extended asymmetric unit of the title compound, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level. [Symmetry code: (iv)  $x, -y + 1/2, z - 1/2$ .]

**Figure 2**

A view of the three-dimensional network of the title compound, projected perpendicular to the *bc*-plane.

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
